

3K CONTROL RAM

The 3K Control Ram is a standard logic card containing a fast (90 nsec.) 3072-word by 32-bit read/write microinstruction memory, 8 banks of even faster (40 nsec.) 32-word by 16-bit read/write memory (S registers), and logic to interface those memories to the Alto's microinstruction bus, processor bus, and ALU output. Unlike other microinstruction memories in the Alto, the larger memory of the 3K Control Ram can hold microinstructions and/or data.

RAM-RELATED TASKS

The 3K Control Ram performs data manipulation (as distinct from microcode fetching) functions in response to the microinstruction. Not all tasks are likely to be interested in these functions. Moreover, not all tasks will have the appropriate values for the microinstruction uncommitted. A Ram-related task is defined as one during whose execution the 3K Control Ram card will respond to microinstructions. The standard Alto is wired so that the CPU emulator task is the only Ram-related task.
